ECS 315: Probability and Random Processes **2013/1**

Tutorial 7 — Due: N/A

Lecturer: Prapun Suksompong, Ph.D.

Problem 1. Let $X \sim \mathcal{P}(\alpha)$.

(a) Evaluate $P[X > 1]$. Your answer should be in terms of α.

(b) Compute the numerical value of $P[X > 1]$ when $\alpha = 1$.

Problem 2. A sample of a radioactive material emits particles at a rate of 0.7 per second. Assuming that these are emitted in accordance with a Poisson distribution, find the probability that in one second (i) exactly one is emitted, (ii) more than three are emitted, (iii) between one and four (inclusive) are emitted. [Applebaum, 2008, Q5.27]

Problem 3. Arrivals of customers at the local supermarket are modeled by a Poisson process with a rate of $\lambda = 2$ customers per minute. Let M be the number of customers arriving between 9:00 and 9:05. What is the probability that $M < 2$?

Problem 4. Plot the Poisson pmf for $\alpha = 10$, 30, and 50.

Problem 5. When n is large, binomial distribution Binomial(n, p) becomes difficult to compute directly because of the need to calculate factorial terms. In this question, we will consider an approximation when p is close to 0. In such case, the binomial can be approximated[1] by the Poisson distribution with parameter $\alpha = np$.

(a) Let $X \sim$ Binomial$(12, 1/36)$. (For example, roll two dice 12 times and let X be the number of times a double 6 appears.) Evaluate $p_X(x)$ for $x = 0, 1, 2$.

(b) Compare your answers in the previous part with the Poisson approximation.

(c) Compare `MATLAB` plots of $p_X(x)$ and the pmf of $\mathcal{P}(np)$.

(d) In one of the New York state lottery games, a number is chosen at random between 0 and 999. Suppose you play this game 250 times. Use the Poisson approximation to estimate the probability that you will never win and compare this with the exact answer.

[1] More specifically, suppose X_n has a binomial distribution with parameters n and p_n. If $p_n \to 0$ and $np_n \to \alpha$ as $n \to \infty$, then

$$P[X_n = k] \to e^{-\alpha} \frac{\alpha^k}{k!}.$$

Problem 6. You go to a party with 500 guests. What is the probability that exactly one other guest has the same birthday as you? Calculate this exactly and also approximately by using the Poisson pmf. (For simplicity. exclude birthdays on February 29.) [Bertsekas and Tsitsiklis, 2008, Q2.2.2]

Problem 7. (6 pt) [M2011/1] You are given an unfair coin with probability of obtaining a head equal to $1/3,000,000,000$. You toss this coin 6,000,000,000 times. Let A be the event that you get "tails for all the tosses". Let B be the event that you get "heads for all the tosses".

(a) (5 pt) Approximate $P(A)$.

(b) (1 pt) Approximate $P(A \cup B)$.
