HW 8 — Due: Not Due Solution

Lecturer: Prapun Suksompong, Ph.D.

Problem 1. State the Nyquist's (first) criterion for zero ISI

(a) In the time domain.

the time domain.

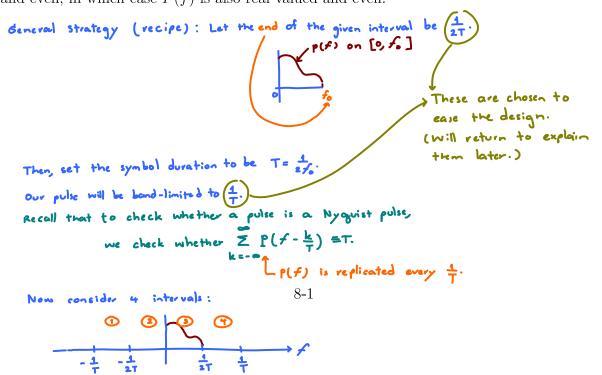

$$p(t) = \begin{cases} 1, & t = 0 \\ 0, & t = \pm T, \pm 2T, \pm 3T, \dots \\ - & \text{symbol duration} \end{cases}$$
interval

(b) In the frequency domain.

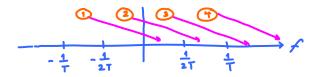

Reminder: A pulse pcts is called a Nyquist pulse iff it satisfies &

Problem 2. In each part below, a pulse P(f) is defined in the frequency domain from f = 0 to f = 1. Outside of [0, 1], your task is to assign value(s) to P(f) so that it becomes a Nyquist pulse. Of course, you will also need to specify the symbol interval T as well.

Hint: To avoid dealing with complex-valued P(f), you may assume that p(t) is real-valued and even; in which case P(f) is also real-valued and even.

Note that when f(f) is copied to $\frac{4}{7}$, its content in region (1) will show up in region (3)

Therefore, when we add P(f) in region (1) and P(f) in region (3), we must have T.

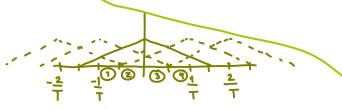

In other words, P(f) in region () can be found by T-P(f)
in region ()

(hinted)
The suggested symmetry in P(f) allow us to find

P(f) in region (3) by flipping P(f) in region (3) horizontally

P(f) in region (by flipping I(f) in region (horizontally.

Remark: We don't want P(f) to be non-zero outside region O-O because when we apply $ZP(f-\frac{k}{T})$, if P(f) is too wide, we will have to deal with many everlapping replicas.

We don't went P(f) to be zero inside region (4) (and hance (1)) because we may need it to "concel" the region (3) value to get the Σ to be T.

This is why we set the provided portion of P(f) to be in region 3).

For this question, we have for = 1. Therefore, we will choose

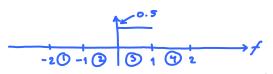

$$T = \frac{1}{2f_0} = 0.5.$$
 $\Rightarrow \frac{1}{T} = 2$ and $\frac{1}{2T} = 1$.

The four regions under consideration are ① fe[-2,-1)

- (1) f & [-1,0)
- (3) f e [0,1)
- ⊕ f ∈ [1,2]

The question specifies P(x) in region 3 as discussed above. We will use the strategy described above to find P(x) which is band-limited to $\frac{1}{4}$.

(a) Find a Nyquist pulse P(f) whose P(f) = 0.5 on [0, 1].

Note that in region 3, P(f) = T already. Therefore, we need nothing from region (1);

-2(1)-1(2) (3) 1 (9) 2 in other words, P(f) =0 in region (1)

The values in region 2 and 4 are from the symmetry in P(f).

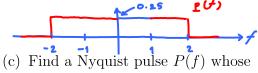

(There is no need to check whether f(f) satisfies the Nyquist criterion again because it is constructed by our general recipe)

(b) Find a Nyquist pulse P(f) whose P(f) = 0.25 on [0, 1].

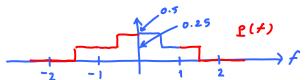

region 3

So, we will set the value in region 1 to be T-0.25 = 0.5-0.25 = 0.25.

The values in region 1 and 1 are from the symmetry in l(f).

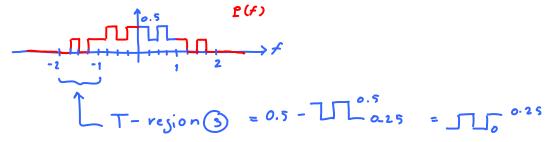

$$P(f) = \begin{cases} 0.5, & 0 \le f < 0.5 \\ 0.25, & 0.5 \le f \le 1 \end{cases}$$

As before, the value in region (1) is $T - region(3) = 0.5 - \frac{0.5}{2}$

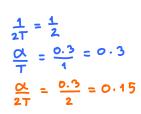

(d) Find a Nyquist pulse P(f) whose

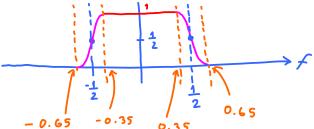

$$P(f) = \begin{cases} 0.5, & f \in [0, 0.25) \cup [0.5, 0.75) \\ 0.25, & f \in [0.25, 0.5) \cup [0.75, 1] \end{cases}$$

Problem 3. Consider a raised cosine pulse $p_{\rm RC}(t;\alpha)$ and its Fourier transform $P_{\rm RC}(f;\alpha)$. Assume the rolloff factor $\alpha=0.3$ and the symbol "duration" T=1.

(a) Carefully sketch $P_{RC}(f; \alpha)$.

(b) Find $p_{\rm RC}(2; lpha)$. The valued cosine pulse is a Nyaguist pulse.

There fore,
$$P(t) = \begin{cases} 1, & t=0 \\ 0, & t=\pm T, \pm 2T, \pm 3T, ... \end{cases}$$

Here, $T = 1$.
Hence, $P(t) = \begin{cases} 1, & t=0 \\ 0, & t=\pm 1, \pm 2, \pm 3, ... \end{cases}$

In purticular, p(2) =0

(c) Find $P_{RC}(0.5; \alpha)$.

Note that $P(\frac{1}{2T}) = \frac{T}{2}$. Here, T=1. Hence, $P(\frac{1}{2}) = \frac{1}{2}$.

(d) Find $P_{RC}(0.3; \alpha)$.

From part (a), we've seen that P(f) = 1 for $f \in [-0.35, 0.35]$. Therefore, P(0.3) = 1.

(e) *Find $P_{RC}(0.4; \alpha)$.

This is the valued port of RC.
$$\rho(0.4) = \frac{1}{2} \left(1 + \cos\left(\frac{\pi}{2} \times \frac{0.05}{0.3} \right) \right)$$

$$= \frac{1}{2} \left(1 + \cos\left(\frac{\pi}{2} \times \frac{0.05}{0.3} \right) \right)$$

$$= \frac{2 + \sqrt{3}}{4} \approx 0.933$$

Remark: You should be able to solve this problem without referring to the "ugly" expression (8.1) below.

£

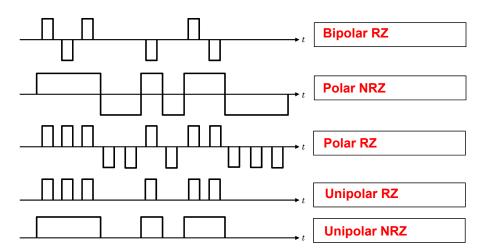

Problem 4 (F2016,Q12). In a PCM system, an analog message is sampled at 5,000 [Sa/s] and then uniformly quantized into 128 different levels.

(a) What is the (theoretical) maximum frequency of the analog message that can be used under such system without aliasing?

(b) Calculate the bit rate of this system.

(c) Determine the signal-to-quantization-noise power ratio in dB when the message is a full-load sinusoidal modulating wave.

Problem 5 (F2016, Q14). For each of the plots below, indicate which type of line code is being used. Put your answer in the provided box to the right of each plot. In all cases, the bit sequence used is 1 1 1 0 0 1 0 1 1 0 0 0.

Possible answers are "Unipolar RZ", "Unipolar NRZ", "polar RZ", "polar RZ", "bipolar RZ", "bipolar NRZ", "Manchester"

Extra Question

Here is an optional question for those who want more practice.

Problem 6. Consider a raised cosine pulse $p_{RC}(t; \alpha)$ with rolloff factor α and symbol "duration" T. Its time domain expression is

$$p_{\rm RC}(t;\alpha) = \frac{\cos\frac{\alpha\pi t}{T}}{1 - \frac{4\alpha^2 t^2}{T^2}} \operatorname{sinc} \frac{\pi t}{T} = \frac{\cos\frac{\alpha\pi t}{T}}{1 - \frac{4\alpha^2 t^2}{T^2}} \frac{\sin\frac{\pi t}{T}}{\frac{\pi t}{T}}.$$
 (8.1)

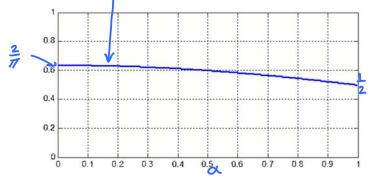

(a) Find p(T/2) as a function of α .

At
$$t = \frac{T}{2}$$
, we have $\frac{t}{T} = \frac{1}{2}$

$$p_{RC}(\frac{T}{2}; \alpha) = \frac{\cos(\alpha \frac{\pi}{2})}{1 - \alpha^2} \frac{\sin(\frac{\pi}{2})}{\frac{\pi}{2}}$$

$$= \frac{2}{\pi} \times \frac{\cos(\alpha \frac{\pi}{2})}{1 - \alpha^2}$$

- (b) Use MATLAB to plot p(T/2) as a function of α .
- (c) Find $\lim_{\alpha \to 1} p_{RC}\left(\frac{T}{2}; \alpha\right)$.

Note that when
$$\alpha = 0$$
, $p_{RC}(\frac{1}{2}; \alpha) = \frac{2}{\pi} \approx 0.6366$
As $\alpha \to 1$, $p_{RC}(\frac{1}{2}; \alpha) \to \frac{2}{\pi} \times \frac{\sqrt{2}(-\sin(\alpha \frac{\pi}{2}))}{-2\alpha} \Big|_{\alpha=1} = \frac{1}{2}$.
