# Electromagnetic Spectrum

IR = infrared

UV = ultraviolet

▨ = visible light

$\longrightarrow$   $\longleftarrow$   
 known in  
 Maxwell's day

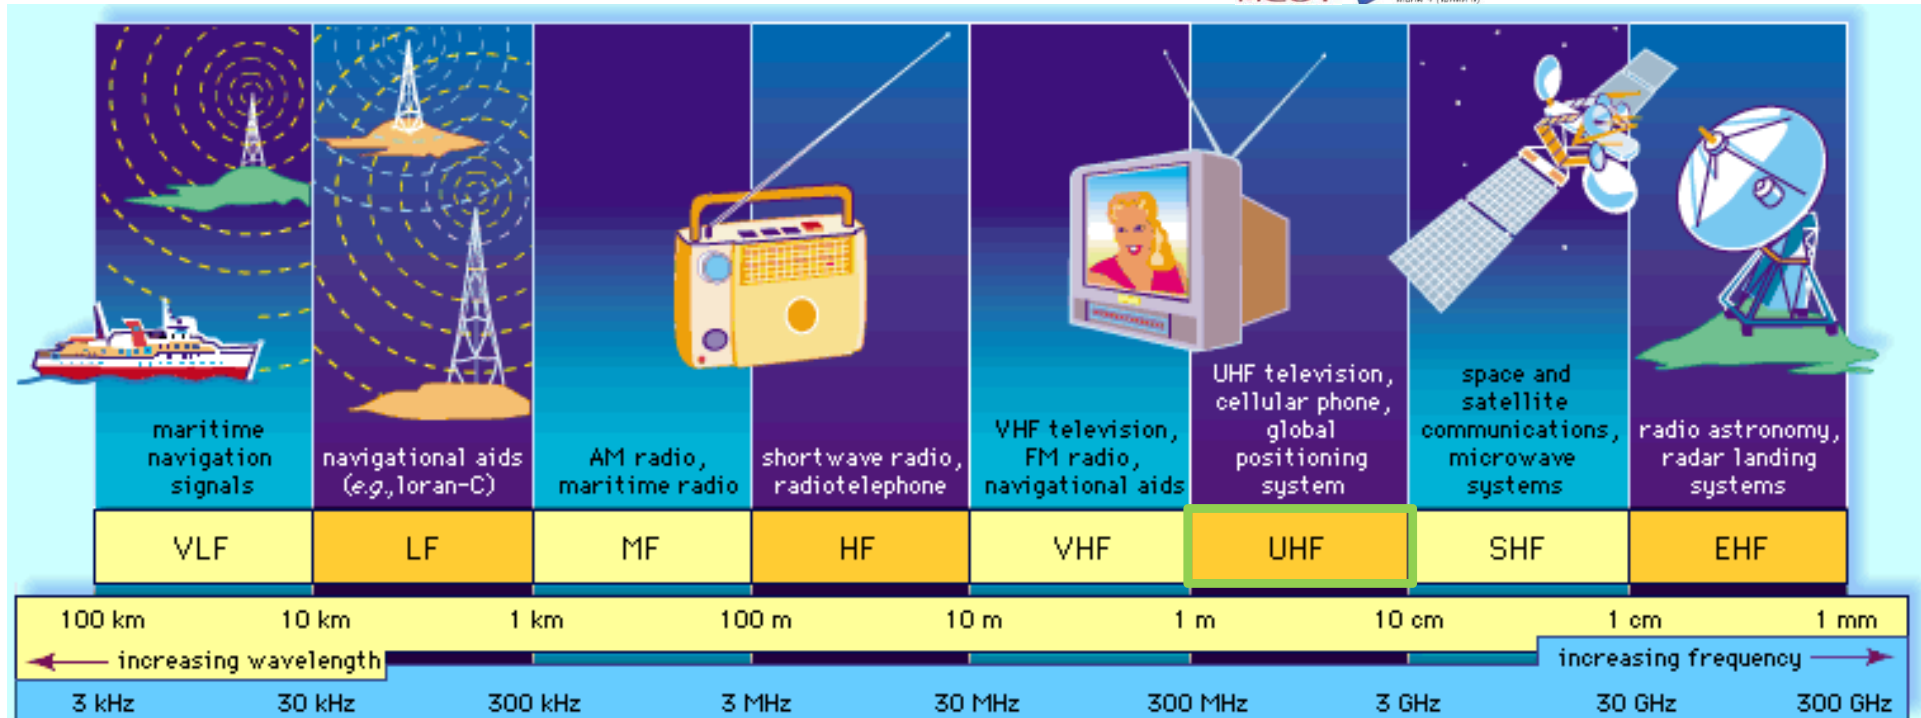

[Gosling, 1999, Fig 1.1 and 1.2]

| $f$   | kHz        |     |     | MHz    |     |     | GHz         |     |
|---|------------|-----|-----|--------|-----|-----|-------------|-----|
|   | Hz         |     |     |        |     |     |             |     |
| 300   | 3          | 30  | 300 | 3      | 30  | 300 | 3           | 30  |
| <b>ELF   SLF   VLF   LF   MF   HF   VHF   UHF   SHF   EHF</b> |            |     |     |        |     |     |             |     |
| $\lambda$   | kilometres |     |     | metres |     |     | millimetres |     |
|   | Mega metre | 100 | 10  | 1      | 100 | 10  | 1           | 100 |

$c = f \lambda$   
 $3 \times 10^8$  m/s  $\swarrow$   $\nwarrow$   $\swarrow$   $\nwarrow$   
 Frequency Wavelength

# Radio-frequency spectrum

- Commercially exploited bands

© 1999 Encyclopædia Britannica, Inc.

$$c = f \lambda$$

$3 \times 10^8 \text{ m/s}$  (points to  $c$ )  
 Wavelength (points to  $\lambda$ )  
 Frequency (points to  $f$ )

Note that the freq. bands are given in decades; the VHF band has 10 times as much frequency space as the HF band.

# Cellular Bands

- All cellular phone networks worldwide use a portion of the radio frequency spectrum designated as **ultra high frequency (UHF)** (300 MHz to 3 GHz)
  - The UHF band is also used for television, GPS, Wi-Fi, and Bluetooth transmission.
  - Due to historical reasons, radio frequencies used for cellular networks differ in the Americas, Europe, and Asia.
- Frequency bands recommended by ITU-R (in June 2003) for terrestrial Mobile telecommunication IMT-2000:
  - 806-960 MHz
  - 1710-2025 MHz
  - 2110-2200 MHz
  - 2500-2690 MHz

# FDD and TDD LTE frequency bands

FDD LTE frequency band allocations

| LTE BAND NUMBER | UPLINK (MHZ)    | DOWNLINK (MHZ)  | WIDTH OF BAND (MHZ) | DUPLEX SPACING (MHZ) | BAND GAP (MHZ) |
|-----------------|-----------------|-----------------|---------------------|----------------------|----------------|
| 1               | 1920 - 1980     | 2110 - 2170     | 60                  | 190                  | 130            |
| 2               | 1850 - 1910     | 1930 - 1990     | 60                  | 80                   | 20             |
| 3               | 1710 - 1785     | 1805 - 1880     | 75                  | 95                   | 20             |
| 4               | 1710 - 1755     | 2110 - 2155     | 45                  | 400                  | 355            |
| 5               | 824 - 849       | 869 - 894       | 25                  | 45                   | 20             |
| 6               | 830 - 840       | 875 - 885       | 10                  | 35                   | 25             |
| 7               | 2500 - 2570     | 2620 - 2690     | 70                  | 120                  | 50             |
| 8               | 880 - 915       | 925 - 960       | 35                  | 45                   | 10             |
| 9               | 1749.9 - 1784.9 | 1844.9 - 1879.9 | 35                  | 95                   | 60             |
| 10              | 1710 - 1770     | 2110 - 2170     | 60                  | 400                  | 340            |
| 11              | 1427.9 - 1452.9 | 1475.9 - 1500.9 | 20                  | 48                   | 28             |
| 12              | 698 - 716       | 728 - 746       | 18                  | 30                   | 12             |

| 58                                 | 766 - 774  | 767.25           | 772.75         |
| 59                                 | 774 - 782  | 775.25           | 780.75         |
| 60                                 | 782 - 790  | 783.25           | 788.75         |

# Lower limits on radio use

- **Efficiency** of an antenna in radiating radio energy is dependent on its length expressed as a fraction of **wavelength**.
  - Too low frequency = too large antenna
- Ex. The “Sanguine” submarine communication system
  - 30 Hz (10,000 km wavelength)
  - Designed (but never built) for the US Navy
  - Base antenna: 24 km square mesh of wires.
  - 10MW RF input
    - Radiate only 147W
    - All the remainder of the power dissipates as heat.

# Upper limits on radio use

Make commu. very dependent on weather conditions

- Atmospheric absorption
  - Atmospheric Opacity/Transparency
- Quasi-optical propagation
  - Short wavelength = Deep shadows behind obscuring objects = Unreliable coverage.
- Increased absorption by building and structural materials

[Gosling, 1999, Fig 1.3]

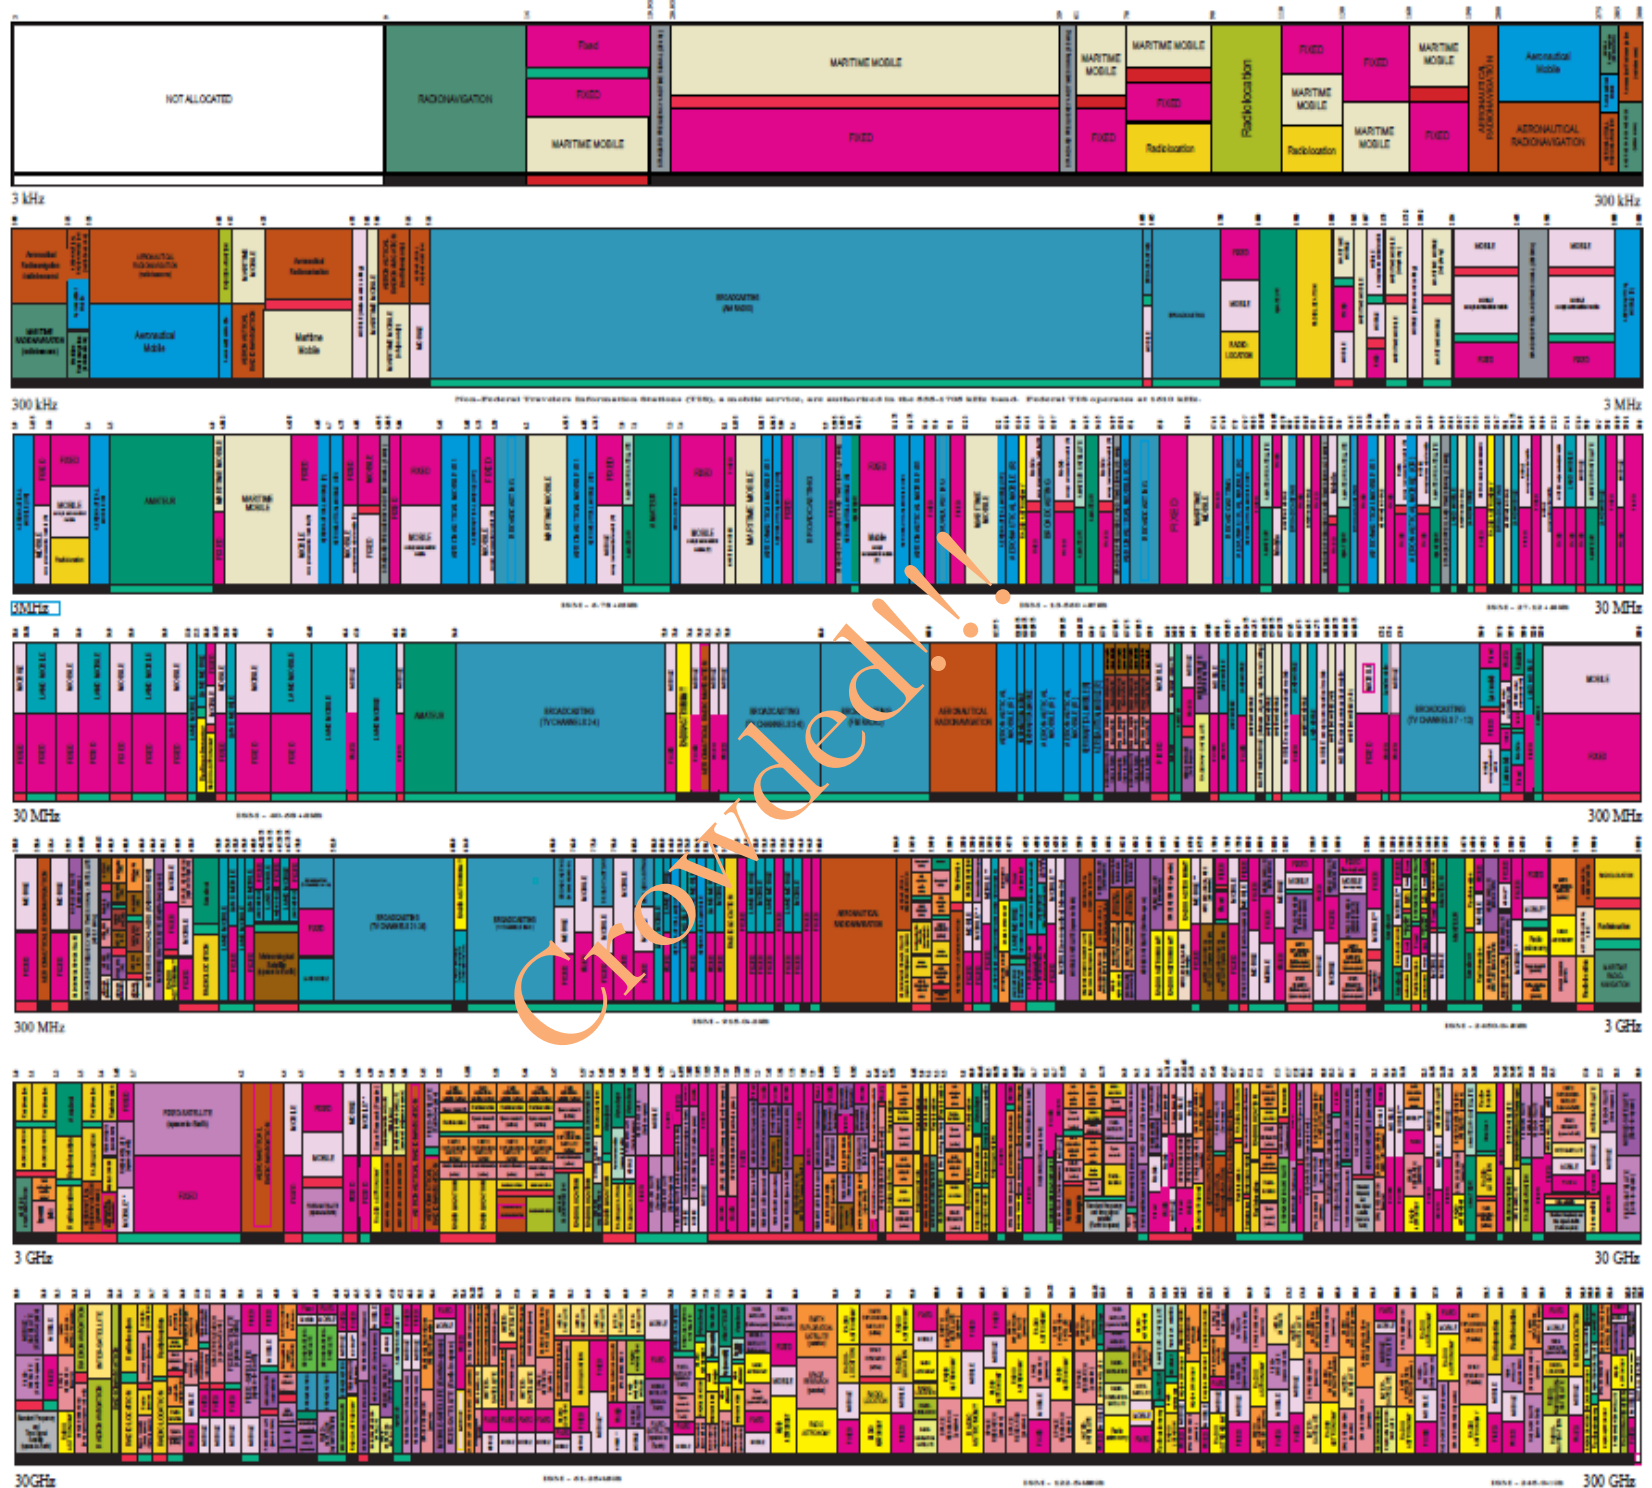

# Spectrum Allocation

- Spectral resource is limited.
- Most countries have government agencies responsible for allocating and controlling the use of the radio spectrum.
- Commercial spectral allocation is governed
  - **globally** by the International Telecommunications Union (**ITU**)
    - ITU Radiocommunication Sector (**ITU-R**) is responsible for radio communication.
  - in the U.S. by the Federal Communications Commission (**FCC**)
  - in Europe by the European Telecommunications Standards Institute (ETSI)
  - in Thailand by the National Broadcasting and Telecommunications Commission (**NBTC**; คณะกรรมการกิจการกระจายเสียง กิจการโทรทัศน์และกิจการโทรคมนาคมแห่งชาติ ; กสทช.)
- Blocks of spectrum are now commonly assigned through **spectral auctions** to the highest bidder.

|  | Maritime radionavigation |  | Standard frequency and time signal-satellite |

# Spectrum Allocation (Final Words)

- Spectrum is a **scarce** resource.
  - “Radio spectrum will be the first of our finite resources to run out, long before oil, gas or mineral deposits.”
- Spectrum is allocated in “chunks” in **frequency** domain.
  - “Chunks” are licensed to (cellular/wireless) operators.
- Within a single cellular operator, the chunk is further divided into many **channels**.
  - Each channel has its own band of frequency.
- Mobile networks based on different standards may use the same “frequency chunk”.
  - For example, AMPS, D-AMPS, N-AMPS and IS-95 all use the 800 MHz “frequency chunk”.
  - This is achieved by the use of **different channels**.

# Oct 2012: Thailand 2.1GHz Auction

- $\approx 4.5$ bn baht per license (freq chunk)
  - 1 license (chunk) = 5 MHz (UL) + 5 MHz (DL)
  - $\approx 450$  million baht per MHz
  - $\approx 30$  million baht per MHz per year

ผลการคัดเลือกคลื่นความถี่ 3G ย่าน 2100 MHz (2.1 GHz)  
สัมปทาน 15 ปี

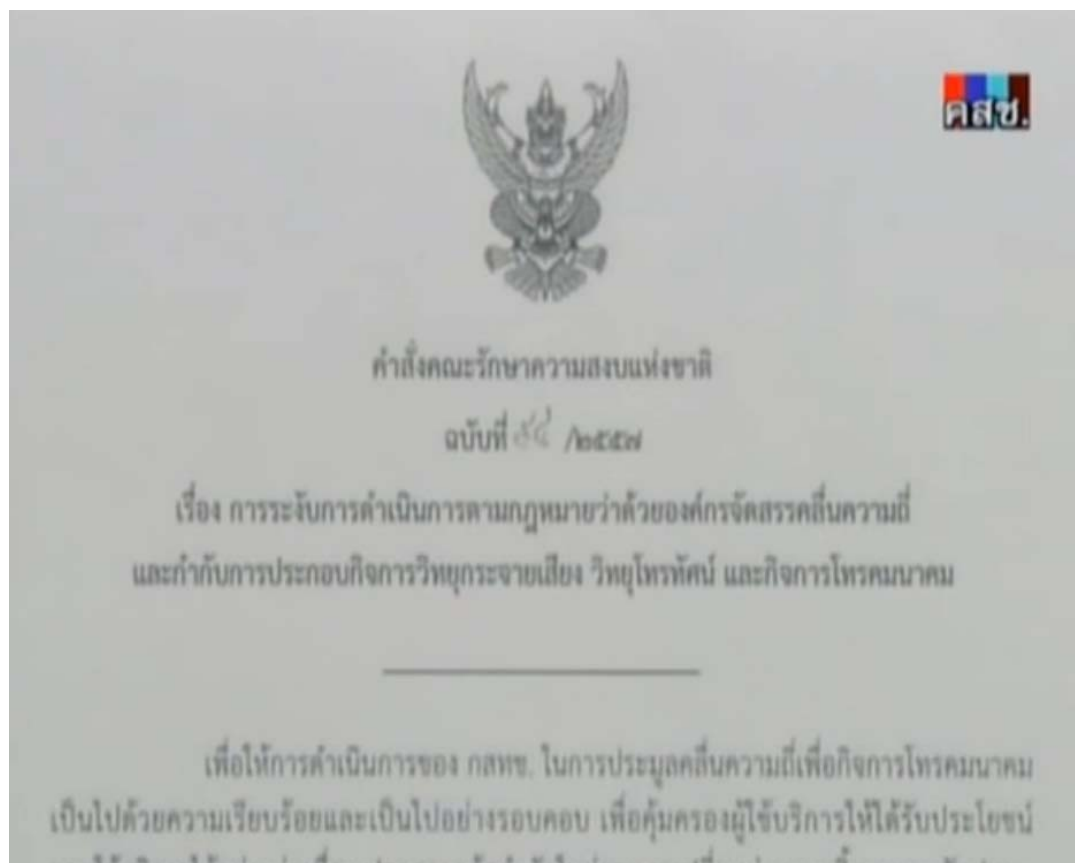

# 2015 Auction(s) (in August?)

- 42.5 MHz of (currently 2G) spectrum
  - 25 MHz of the 1800-MHz spectrum
  - 17.5 MHz of the 900-MHz spectrum
- Previously leased to AIS, TrueMove, and Digital Phone Co (DPC)
  - TrueMove and DPC's 1800 MHz band concession (สัมปทาน) expired since September 2013.
    - Extended for one year by the NBTC's customer protection measures
  - AIS's concession (from TOT) in the 900 MHz band will expire in September 2015.
  - Auctions (planned to be in Aug 2014 and Nov 2014, respectively) were postponed (at least) until July 2015 by an order from the National Council for Peace and Order (NCPO)

# Digital TV License Auction in 2012

News and children's/family channels

# Interesting Book

- Spectrum Wars: The Policy and Technology Debate

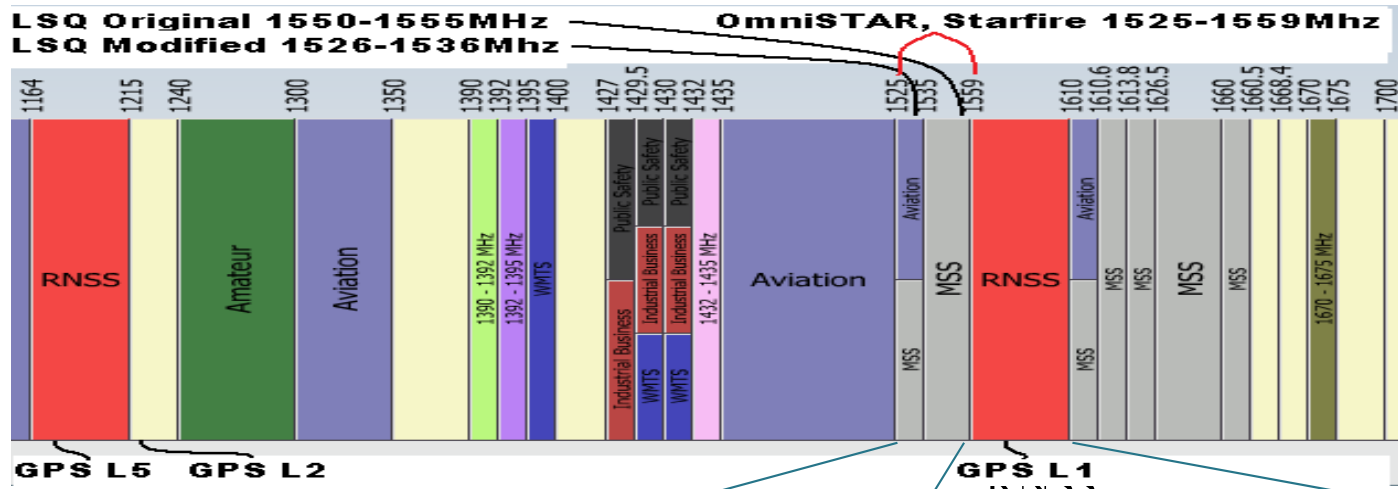

“Designed to help you ensure that your company **wins the battle for the spectrum**, this text maps out the strategies required for structuring entry and operations in the spectrum. It offers advice on how to master the lobbying, technical, regulatory, legal and political tools needed for success.”

[Manner, 2003]

## News: LightSquared vs. GPS industry

- In Jan 2011, the FCC granted a conditional waiver to **LightSquared** allowing the expansion of terrestrial use (for launching a new **LTE** network) of the **mobile satellite spectrum (MSS)** immediately neighboring that of the **GPS (L1)**
  - As its name suggested, MSS has been reserved for satellite services
  - Earlier, FCC permitted “ancillary” terrestrial uses intended to “fill in” locations where satellite coverage was problematic.
  - The new order allows a high powered nationwide terrestrial broadband network.
- Extremely high-powered ground-based transmissions could potentially cause severe interference to (the relatively faint) GPS receivers.

# Completely Separated?

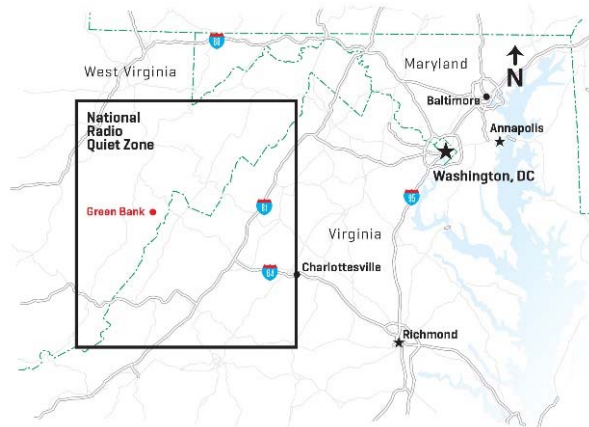

- GPS receivers have filters that do not block signals from the MSS band.

- These filters has enabled both low-cost and high-precision GPS receivers.
- Assumption: Signals in MSS band were low-power.
- Latest updates: See [www.gps.gov/spectrum/lightsquared/](http://www.gps.gov/spectrum/lightsquared/)

# Electromagnetic silence in a town where wireless signals are forbidden

- 13,000 sq miles (33,000 sq km) **National Radio Quiet Zone**
- Green Bank, West Virginia
- Wi-Fi, cellphones, Bluetooth, AM radio are banned under state law.
  - Residents are allowed to use land-line phones and wired internet
  - The only way anyone just passing through can reach the rest of the world is by using the pay phone on the side of a road in town
- Only diesel vehicles are allowed on-site, because a gasoline-powered engine's spark plugs give off interfering radiation.
- The cafeteria's microwave is kept in a shielded cage.
- The Interference Protection Group was formed to hunt down rogue signals.

# Robert C. Byrd radio telescope

- Green Bank is the site of the gigantic Robert C. Byrd radio telescope.
  - In recent years, the telescopes have been used to track NASA's Cassini probe to Saturn's moon and to examine Mercury's molten core.
  - So sensitive that it can pick up the energy equivalent of a single snowflake hitting the ground.
- Even a basic AM radio transmission is enough to overpower faint readings from outer space.

# Unforeseen newcomers

- Diane Schou
- She believed the cell-phone tower near her home in Iowa is the source of her illness.
  - Symptoms range from acute headaches, skin burning, muscle twitching and chronic pain.
- She spent months living in a Faraday cage (shielded cage), a wood-framed box with metal meshing that blocked out cell signals.

Wi-Fi Refugees move to Green Bank to escape electromagnetic radiation

# Unforeseen newcomers

- **Electrosensitivity**
  - Formally, **Electromagnetic Hypersensitivity (EHS)**
    - Or Idiopathic environmental intolerance attributed to electromagnetic fields (IEI-EMF)
  - 5%? of Americans. (Estimates vary widely.)
  - Claim that exposure to electromagnetic fields (EMF) (typically created by mobile phones, wi-fi and other electronic equipment) makes them physically ill.
  - Whether EHS is real is still debatable.
    - Not medically recognized in the US.
    - Sweden is the first country to recognize EHS as a disability.
- Since 2007, electrosensitives started to move into Green Bank.
- Electrosensitives' demands clash with locals.
  - They demand that local businesses uninstall fluorescent lights, and want a church to stop using wireless microphones.

# Unlicensed bands

- Frequency bands that are **free to use**
  - according to a specific set of **etiquette rules**.
- The purpose of these unlicensed bands is to encourage **innovation** and **low-cost** implementation.
- Many extremely successful wireless systems operate in unlicensed bands, including **wireless LANs, Bluetooth, and cordless phones**.
- Major difficulty:
  - If many unlicensed devices in the same band are used in close proximity, they generate much **interference** to each other, which can make the band unusable.

# Unlicensed bands (2)

- Unlicensed spectrum is allocated by the governing body within a given country.
- Often countries try to match their frequency allocation for unlicensed use so that technology developed for that spectrum is compatible worldwide.
- The following table shows the unlicensed spectrum allocations in the U.S.

(ISM = Industrial, Scientific, and Medical)

|         |  |                 |
|---------|--|-----------------|
| 900 MHz | ISM Band I (Cordless phones, 1G WLANs)               | 902-928 MHz     |
| 2.4 GHz | ISM Band II (Bluetooth, 802.11b WLANs)               | 2.4-2.4835 GHz  |
| 5.8 GHz | ISM Band III (Wireless PBX)                          | 5.725-5.85 GHz  |
| 5 GHz   | NII Band I (Indoor systems, 802.11a WLANs)           | 5.15-5.25 GHz   |
| 5 GHz   | NII Band II (short outdoor and campus applications)  | 5.25-5.35 GHz   |
| 5.8 GHz | NII Band III (long outdoor and point-to-point links) | 5.725-5.825 GHz |

# Licensed vs. Unlicensed Spectra

| Licensed  | Unlicensed  |
|---|---|
| Typically nationwide.<br>Over a period of a few years.<br>From the spectrum regulatory agency.                                | For experimental systems and to aid development of new wireless technologies. |
| Bandwidth is very expensive.  | Very cheap to transmit on.  |
| No hard constraints on the power transmitted within the licensed spectrum but the power is expected to decay rapidly outside. | There is a maximum power constraint over the entire spectrum.                 |
| Provide immunity from any kind of interference outside of the system itself.  | Have to deal with interference.   |

# Ex. Wi-Fi Standards

- 802.11a/b/g/n operate in the 2.4 GHz band.
- 802.11n optionally supporting the 5 GHz band.
- The new 802.11ac standard mandates operation only in the 5 GHz band.
  - 2.4 GHz band is susceptible to greater interference from crowded legacy Wi-Fi devices as well as many household devices.
  - The 5 GHz band has relatively reduced interference and there are a greater number of nonoverlapping channels available (**25** non-overlapping channels in US) compared to the 2.4 GHz band (**3** non-overlapping channels in the US).

# 2.4 GHz has > 10 Channels?

- In the US, FCC regulations permit channels 1 to 11 to be used.
- Channels 10 and 11 are the only channels which are common throughout the world.
- Channel 14, where available, is restricted to 802.11b operation only.

[[http://www.iceghn.org/wiki/index.php/Wireless\\_LAN\\_802.11\\_Wi-Fi](http://www.iceghn.org/wiki/index.php/Wireless_LAN_802.11_Wi-Fi)]

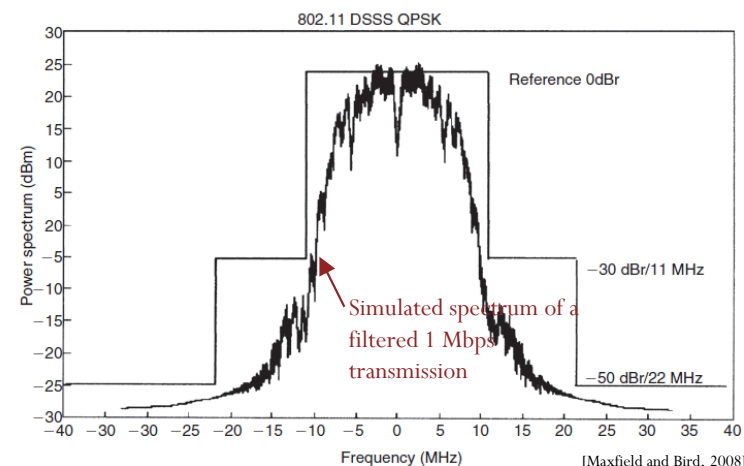

Can many networks generally operate in close proximity without interfering with each other?

# 2.4 GHz Channels in Various Parts of the World

| Channel         | MHz  | U.S. | Canada | Europe (ETSI) | Spain | France | Japan |
|-----------------|------|------|--------|---------------|-------|--------|-------|
| 1               | 2412 | ×    | ×      | ×             |       | ×      | ×     |

| 9               | 2452 | ×    | ×      | ×             |       | ×      | ×     |
| 10              | 2457 | ×    | ×      | ×             | ×     | ×      | ×     |
| 11              | 2462 | ×    | ×      | ×             | ×     | ×      | ×     |
| 12              | 2467 |      |        | ×             |       | ×      | ×     |
| 13              | 2472 |      |        | ×             |       | ×      | ×     |
| 14 <sup>a</sup> | 2484 |      |        |               |       |        |       |

<sup>a</sup>Channel 14, where available, is restricted to 802.11b operation.

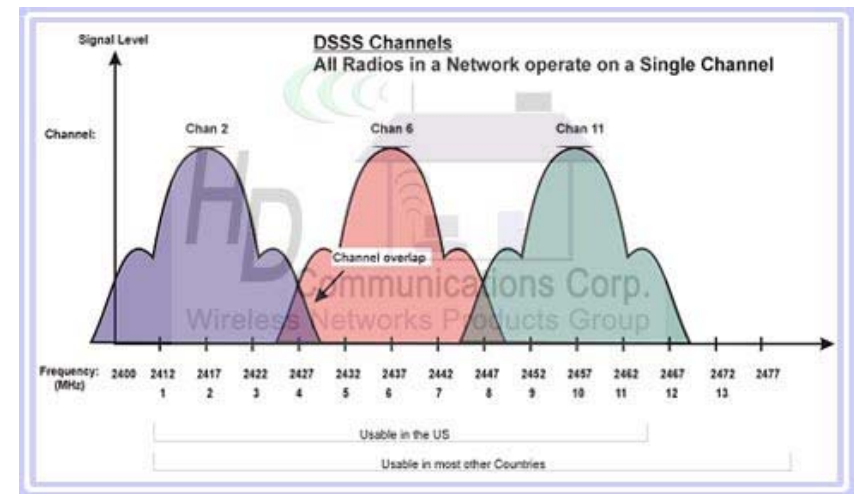

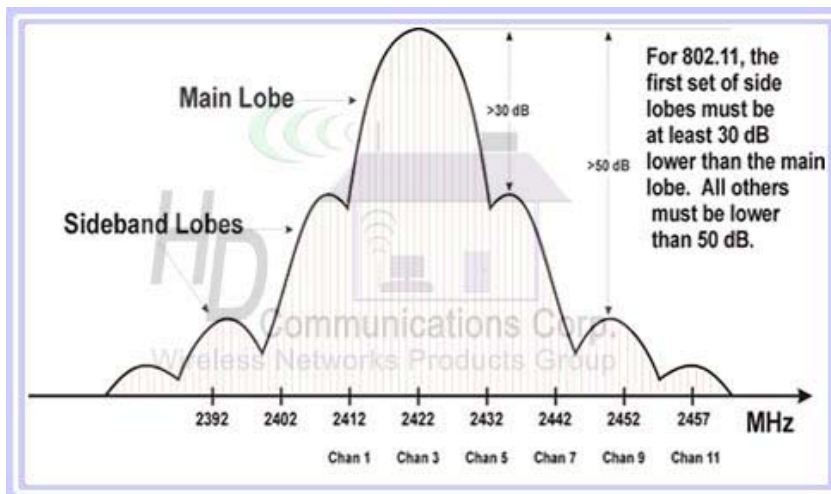

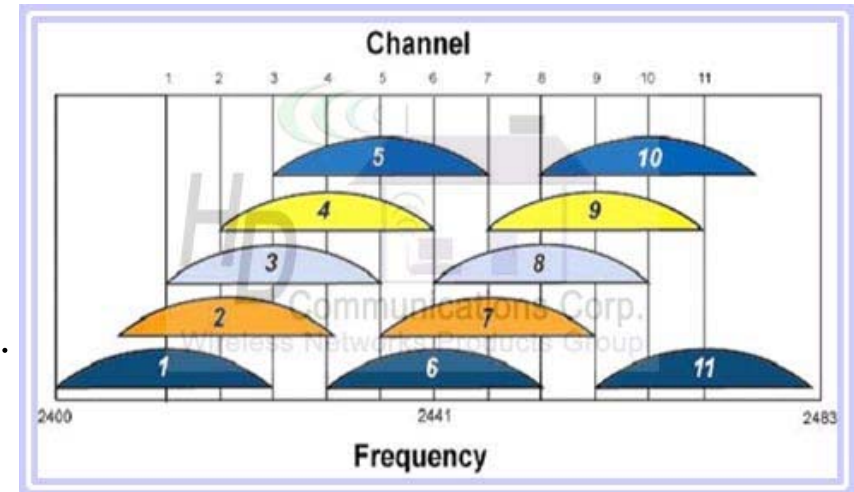

# The 802.11b Spectral Mask

- The 802.11b (and 802.11g) standards do not specify the width of a channel.
  - Rather, they specify the center frequency of the channel and a spectral mask for that channel.
- The energy radiated by the transmitter extends well beyond the 22-MHz bandwidth of the channel ( $\pm 11$  MHz from  $f_c$ ).
  - At 11 MHz from the center of the channel, the energy must be 30 dB lower than the maximum signal level.
  - At 22 MHz away, the energy must be 50 dB below the maximum level.

# WiFi in the 2.4 GHz bands

- It is common to hear that channels 1, 6 and 11 do not overlap.
- It is more correct to say that, given the separation between channels 1, 6, and 11, the signal on any channel should be sufficiently attenuated to minimally interfere with a transmitter on any other channel.
- Same for any two channels that are 5 or more ch. numbers away.
- Tools such as Vistumbler or inSSIDer can help you visualize the WiFi landscape.

# “Non-Overlapping” Channels for 2.4 GHz WLAN

802.11b (DSSS) channel width 22 MHz

802.11g/n (OFDM) 20 MHz ch. width – 16.25 MHz used by sub-carriers

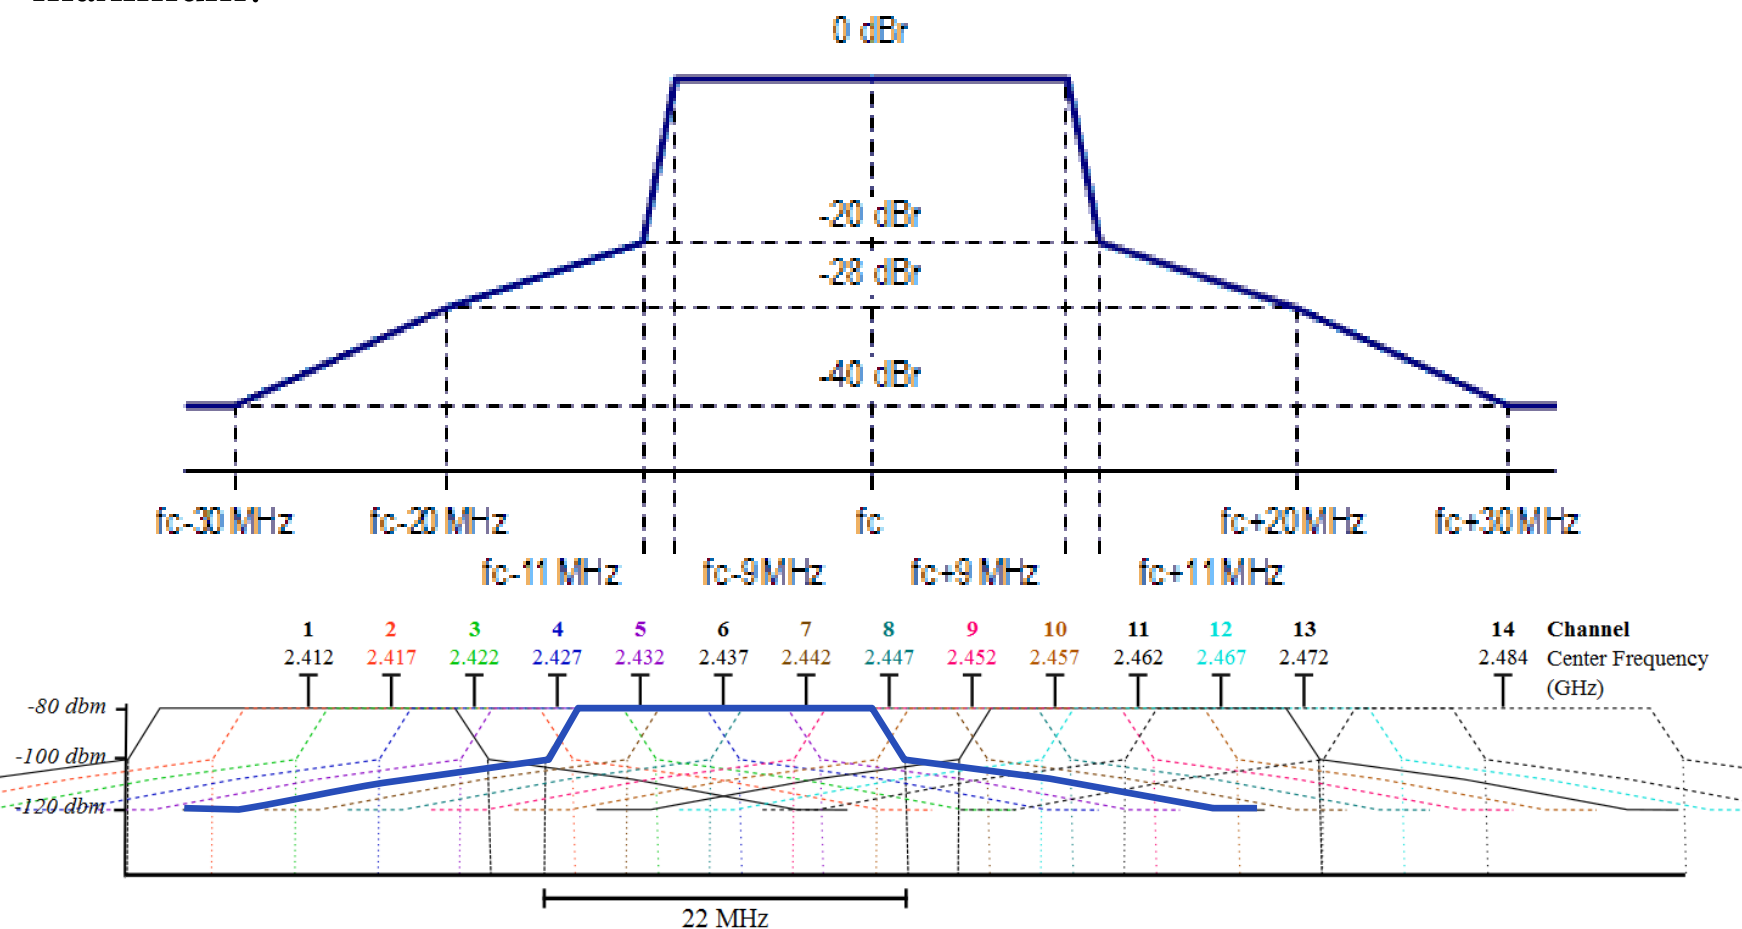

802.11n (OFDM) 40 MHz ch. width – 33.75 MHz used by sub-carriers

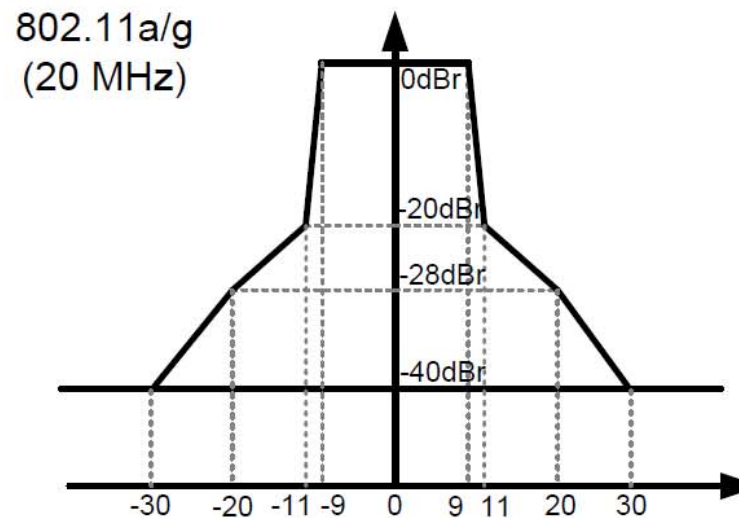

# 802.11g Spectral Mask

- At 11 MHz from the center, the transmitter energy level is only 20 dB below the maximum (as opposed to 35 dB for 802.11b)
- At 22 MHz away, the energy is only about 30 dB below (as opposed to 50 dB for 802.11b). Even as far out as 40 MHz, the energy is still only 40 dB below the maximum.

# Spectral Mask Comparison

# 5 GHz Band Channels

Figure 1: US Channel Allocation

Figure 2: Europe, Japan and Global Operating Class Channel Allocation

# Unlicensed 60 GHz Frequency Band

- A lot of bandwidth available

Worldwide  
spectrum  
availability

- Even for the smallest allocation, there is more than 3 GHz of bandwidth available, and most regions allow use of at least **7 GHz**.
  - In comparison, the 5 GHz unlicensed band has about 500 MHz of total usable bandwidth.
  - The 2.4 GHz band has less than 85 MHz of bandwidth in most regions.
