Evolution of cellular network

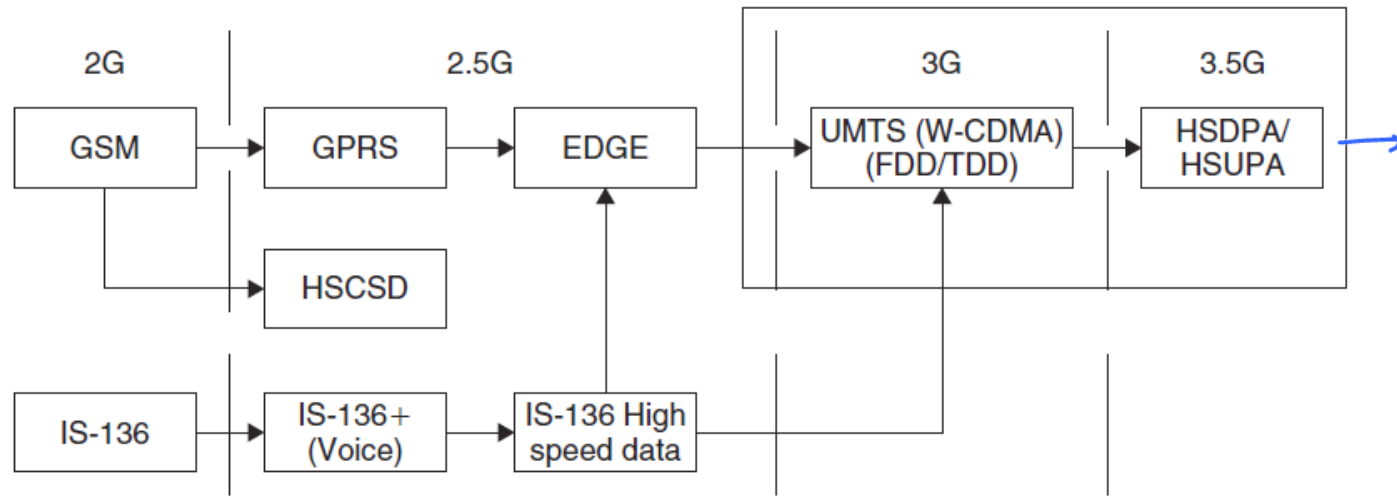

Figure 1.1 Evolution of 2G networks based on TDMA technology.

[Abu-Rgheff, 2007]

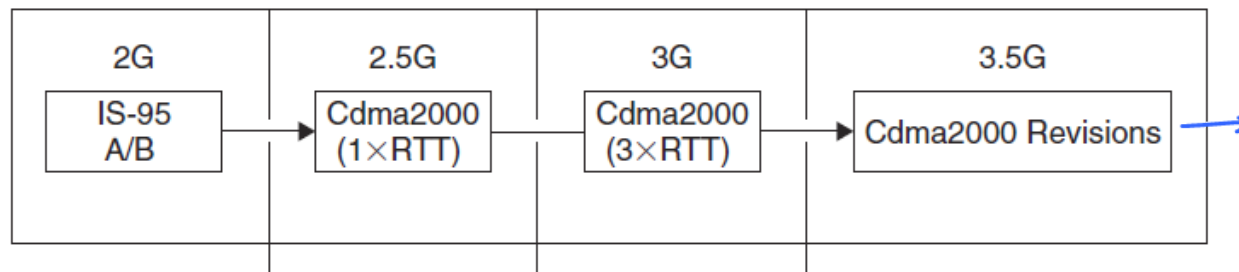

Figure 1.2 Evolution of 2G networks based on CDMA technology.

IS-95 System

cdmaOne

- Based on direct sequence CDMA (**DS-CDMA**)
 - **First** CDMA-based digital cellular standard.
- The brand name for IS-95 is cdmaOne.
 - Also known as TIA-EIA-95.
- Proposed by Qualcomm in 1989 and adopted in 1993.
 - North America
- Replaced by IS-2000 (CDMA2000)
- **1.25 MHz Channel BW**
- 1.228 Mb/s chip rate
- Walsh functions of “order 64” are extensively used in the IS-95 system.
- Remarks
 - IS-95B = cdmaOne
 - Upgrade IS-95A
 - Can carry data at rates up to **14.4 kbps** for IS-95A and **115 kbps** for IS-95B.

64-ary Walsh Functions

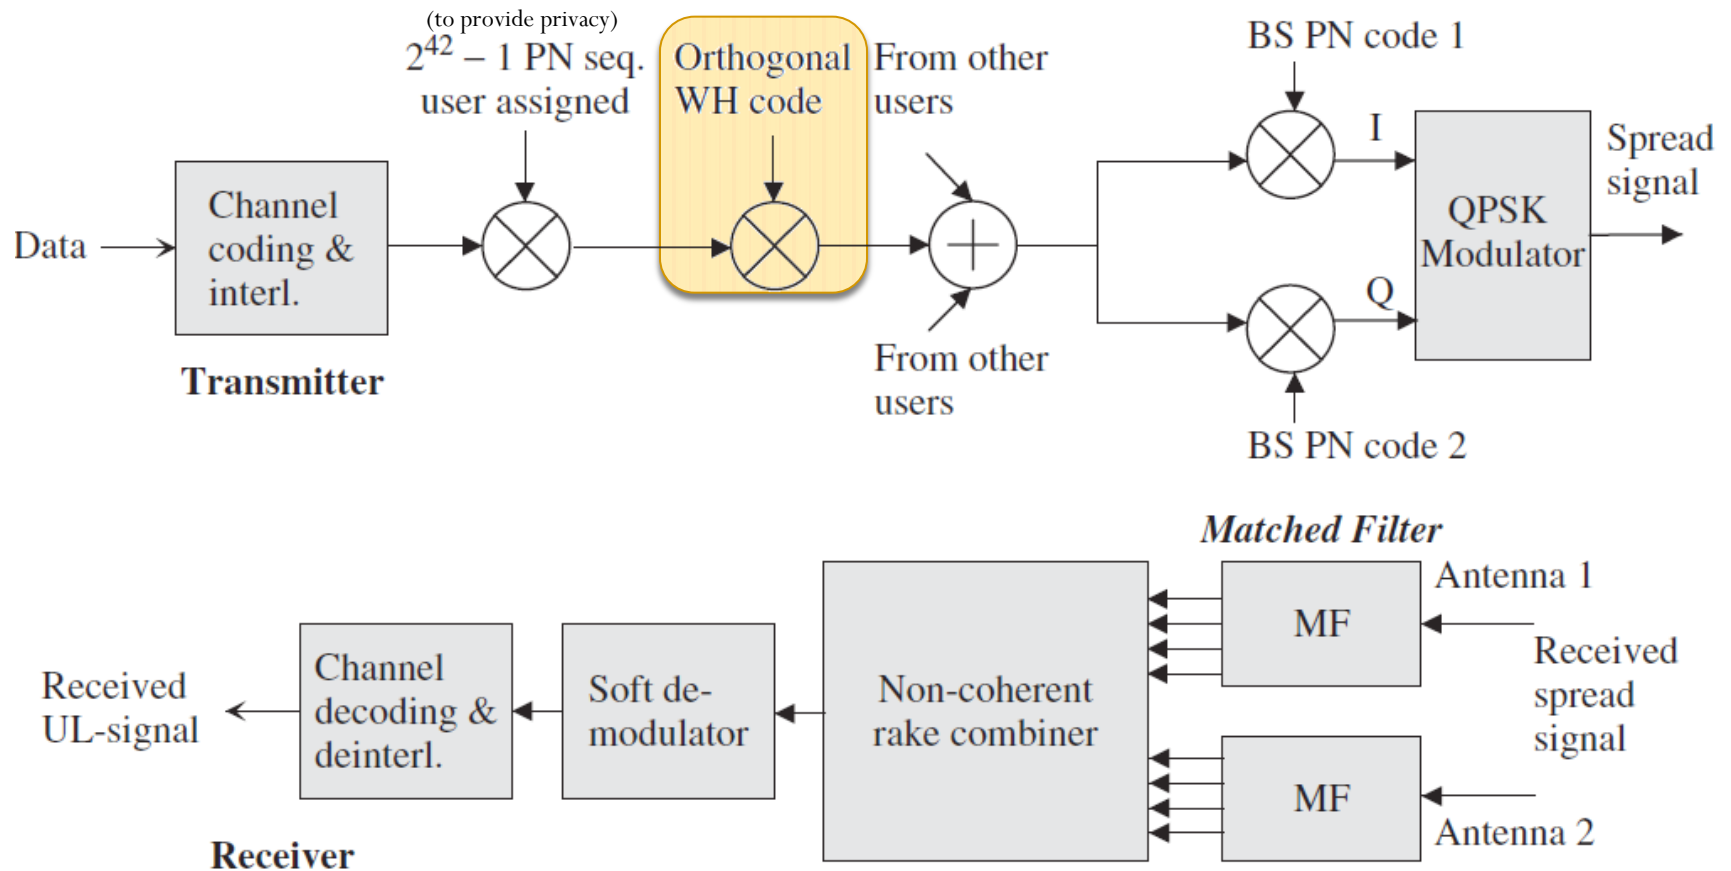

Table 5.8 Walsh functions of order 64, as indexed in IS-95 (W_i is the Walsh notation, and H_i is the Hadamard notation)

Walsh Sequences in IS-95

- **Forward link (Downlink)**
 - QPSK with a chip rate of 1,228,800 per second.
 - The **multiple access scheme** is accomplished by the use of 64-bit spreading orthogonal **Walsh sequences** (functions).
 - The (coded and interleaved) traffic channel signal symbols are multiplied with distinct repeating Walsh sequences that are assigned to each channel for the duration of the call.
 - Every base stations is synchronized with a GPS receiver so transmissions are tightly controlled in time.
- **Reverse link (Uplink)**
 - The Walsh sequences are employed as an **orthogonal modulation code**, which depends only on the data pattern (not channel), forming a 64-ary orthogonal modulation system.

IS-95 base station transceiver

IS-95 terminal station transceiver

IS-95

- The **reverse link** is subject to near-far effects.
- More powerful **error correction** is employed on the reverse link.
 - A rate 1/2 constraint length 9 convolutional code followed by an interleaver on the forward channel
 - A rate 1/3 constraint length 9 convolutional code followed by an interleaver is used on the reverse link.
 - Also with WH(6,64)
 - Interleaving is utilized to avoid large burst errors, which can be very detrimental to convolutional codes.
- **Power control.**
 - Use a subchannel on the forward link
 - Every 1.25 ms the base station receiver estimates the signal strength of the mobile unit.
 - If it is too high, the base transmits a 1 on the subchannel. If it is too low, it transmits a 0.
 - In this way, the mobile station adjusts its power every 1.25 ms as necessary so as to reduce interference to other users.

IS-95: Increased Spectral Efficiency

- Improve frequency reuse.
 - Narrow-band systems cannot use the same transmission frequency in adjacent cells because of the potential for interference.
 - CDMA has inherent resistance to interference.
 - $N = 1$ (theoretically)
 - Although users from adjacent cells will contribute to interference level, their contribution will be significantly less than the interference from the same cell users.
 - Frequency reuse efficiency increases by a factor of 4 to 6.
- When used to transmit voice signals, CDMA systems may exploit the fact that voice activity typically lies at somewhat less than 40%, thus reducing the amount of interference to 40% of its original value.

QCELP

- Qualcomm code-excited linear prediction algorithm
- Used for voice encoding.
- The voice coder exploits gaps and pauses in speech.
- The data rate is variable.
- To keep the symbol rate constant, whenever the bit rate falls below the peak bit rate of 9600 kbit/s, repetition is used to fill the gaps.
 - For example, if the output of the voice coder (and subsequently the convolutional coder) falls to 2400 bit/s, the output is repeated three times before it is sent to the interleaver.
 - Takes advantage of this repetition time by reducing the output power during three out of the four identical symbols by at least 20 dB.
 - In this way, the multiple-access interference is reduced.
- This voice activity gating reduces interference and increases overall capacity.
