

EES 351: In-Class Exercise # 9

Instructions

1. Work alone or in a group of no more than three students. For group work, **the group cannot be the same as any of your former groups in this class.**
2. **[ENRE] Explanation is not required for this exercise.**
3. Only one submission is needed for each group.
4. You have two choices for submission:
 - (a) Online submission via Google Classroom
 - PDF only.
 - Only for those who can directly work on the posted files using devices with pen input.
 - Paper size should be the same as the posted file.
 - No scanned work, photos, or screen capture.
 - Your file name should start with the 10-digit student ID of one member.
(You may add the IDs of other members, exercise #, or other information as well.)
 - (b) Hardcopy submission
5. **Do not panic.**

1. Consider the “modulator” shown below. Note that the first operation is a summation (not multiplication).

$(\cdot)^2$ is a “square” device; its output is created by squaring its input in the **time** domain.

$H_{BP}(f)$ is an LTI device whose **frequency response** is

$$H_{BP}(f) = \begin{cases} 1, & |f - f_c| \leq 332, \\ 1, & |f + f_c| \leq 332, \\ 0, & \text{otherwise.} \end{cases}$$

Let $A_c = 2$, $f_c = 2018$, and

$$M(f) = \begin{cases} 1, & |f| \leq 54, \\ 0, & \text{otherwise.} \end{cases}$$

a. Plot the corresponding $X(f)$.

$$v(t) = (m(t) + 2\cos(2\pi(2018)t))^2 = m^2(t) + 4\cos^2(2\pi(2018)t) + 4m(t)\cos(2\pi(2018)t).$$

$v(t)$ is input into a band-pass filter. So, we should look at $V(f)$.

There are three terms in $v(t)$. Let’s analyze them in the frequency domain separately.

(1) By the convolution-in-frequency property: $m^2(t) \stackrel{F}{\Leftrightarrow} M(f) * M(f)$.

In lecture, we have seen how to do self-convolution of a rectangular function. In this problem, $a = -54$, $b = 54$, $h = 1$, and the dummy variable is f instead of t . This gives

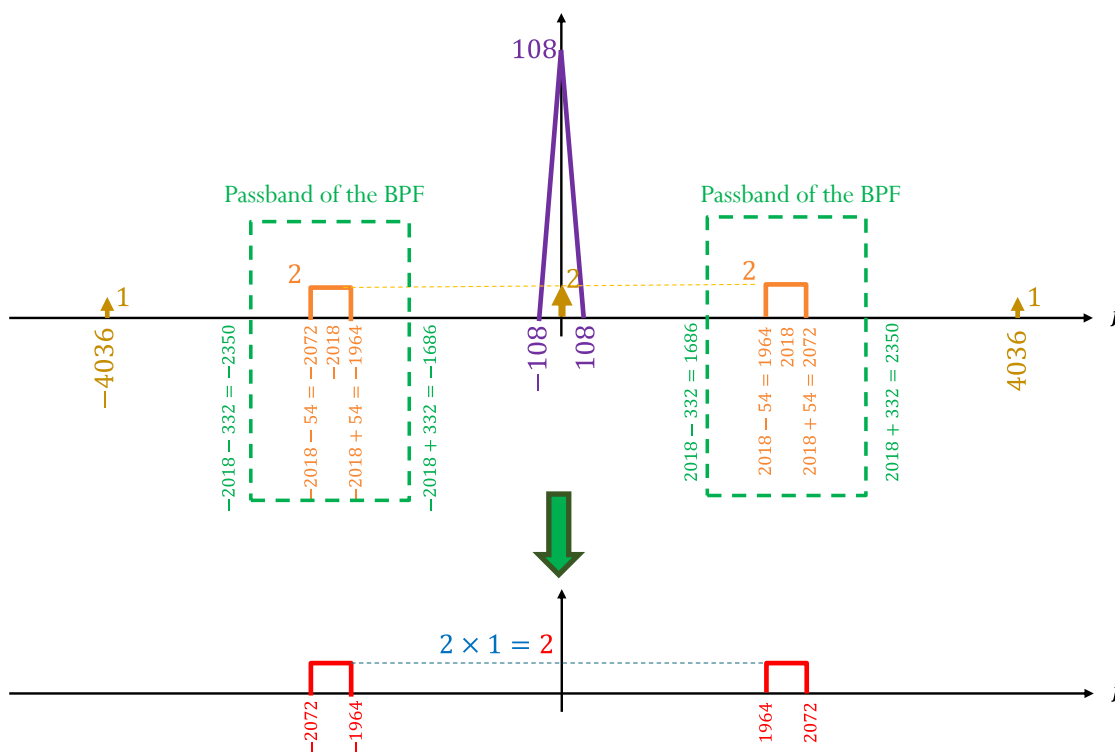

(Actually, the actual shape of the convolution is not as important as the fact that the result is band-limited to **108 Hz**.)

(2) From $\cos^2 \theta = \frac{1}{2}(1 + \cos(2\theta))$, we have

$$4\cos^2(2\pi(2018)t) = 2 + 2\cos(2\pi(4036)t).$$

(3) Fourier transform of the term $4m(t)\cos(2\pi(2018)t)$ can be found by our modulation formula:

$$g(t)A\cos(2\pi(f_c)t) \stackrel{F}{\Leftrightarrow} \frac{A}{2}G(f - f_c) + \frac{A}{2}G(f - (-f_c)).$$

b. (Optional) Find $m(t)$ and $x(t)$.

$M(f)$ is a rectangular function in the frequency domain. So, $m(t)$ is a sinc function in the time domain.

The area of the rectangular function is $1 \times 54 - (-54) = 108$. So,

$$m(t) = 108 \operatorname{sinc}(2\pi f_m t),$$

for some f_m .

The width of the rectangular function is $54 - (-54) = 108$. So, the first zero-crossing of the sinc

function should occur at $t = \frac{1}{108}$. From $\operatorname{sinc}(\theta) = \frac{\sin(\theta)}{\theta}$, we see that the zero-crossings of $\operatorname{sinc}(\theta)$ are the same as the zero-crossings of $\sin(\theta)$ (except when $\theta = 0$).

$$\text{Period of sine} = 2 \times \frac{1}{108}.$$

$$\text{Frequency of sine} = \frac{1}{\text{Period of sine}} = \frac{108}{2}$$

$$\text{So, } f_m = \frac{108}{2} \text{ and } m(t) = 108 \operatorname{sinc}(108\pi t)$$

Back in the analysis of $v(t)$, we saw that $4m(t)\cos(2\pi(2018)t)$ passes through the filter unchanged.

$$\text{So, } x(t) = 4m(t)\cos(2\pi(2018)t) = 432 \operatorname{sinc}(108\pi t) \cos(4026\pi t).$$
